

① 测角：两站角域约束

② 求交：闭合可行域 L

③ 覆盖：直径与最小包围圆

基准算例： $\varepsilon = 1^\circ$ ； $D = 39.598$ m, $R_{MEC} = 19.799$ m, $\gamma = 2R_{MEC}/D = 1.000$ 。
同一组边界射线 → 同一组顶点 → 同一最小包围圆；局部面板仅改变显示尺度。
